

Mastering Bioenergetic Harmony

A Practitioner's Guide to the HEXA FLOW LUX

The Language of Analysis: Decoding Energy & Cellular Function

Energy Levels (The Dynamic State)

Represents the fluctuating energy state of an organ, which can be affected by food, stress, or caffeine.

Optimum Dispersion (OD) Value (The Stable Blueprint)

Represents the organ's state at a cellular level, providing a more stable and consistent metric for analysis.

OD values below **1.200** should be the priority focus. Values below **0.900** indicate areas of root cause.

Preparing for the Scan: The Optimal Environment

Empty Stomach: Ideal to scan prior to eating (4 hours preferred, 2 hours acceptable).

No Electronics: Remove cell phones, computers, electronic watches, and heavy jewelry.

Avoid Stimulants: Avoid alcoholic and caffeinated drinks before scans.

Neutral Posture: Avoid crossing legs or arms during the scan. Sitting up or lying down is acceptable.

Clear the Room: Ensure no other large electronics are turned on in the room during scans.

The 3-Step Core Workflow

Before exploring advanced features, new users must master this fundamental cycle: running scans, creating reports, and performing therapies.

Step 1: SCAN – Acquiring the Energetic Blueprint

The Full Body Scan is the essential starting point for comprehensive analysis.

The screenshot shows a web application interface with a navigation bar at the top containing 'OVERVIEW', 'MEDICA', 'RESEARCH', and 'ANALYSIS'. The 'RESEARCH' tab is active. Below the navigation bar, the 'RESEARCH' section is divided into three main areas. On the left, under the heading '1. Select Scan Type', there is a 'RESEARCH TYPE' dropdown menu with 'SCI' selected and a '960+' badge. In the center, under the heading '2. Choose Pre-programmed Scan', there is a 'MANUAL CHOICE' section with 'MALE' and 'FEMALE' buttons. On the right, under the heading '3. Begin', there is a large blue 'SCAN' button with a hand cursor icon. Below the 'SCAN' button, there is a text instruction: 'Ensure the headset is on the person being scanned and click SCAN.'

1. Select Scan Type

RESEARCH TYPE

SCI 960+

On the RESEARCH page, choose the **SCI** scan type for the most complete list of items (960+).

2. Choose Pre-programmed Scan

MANUAL CHOICE

MALE FEMALE

Under MANUAL CHOICE, select the appropriate **MALE** or **FEMALE** full body scan.

3. Begin

SCAN

Ensure the headset is on the person being scanned and click **SCAN**.

Pro-Tip: A full body scan provides the necessary data to identify root causes and should be performed every 6 weeks to track long-term progress.

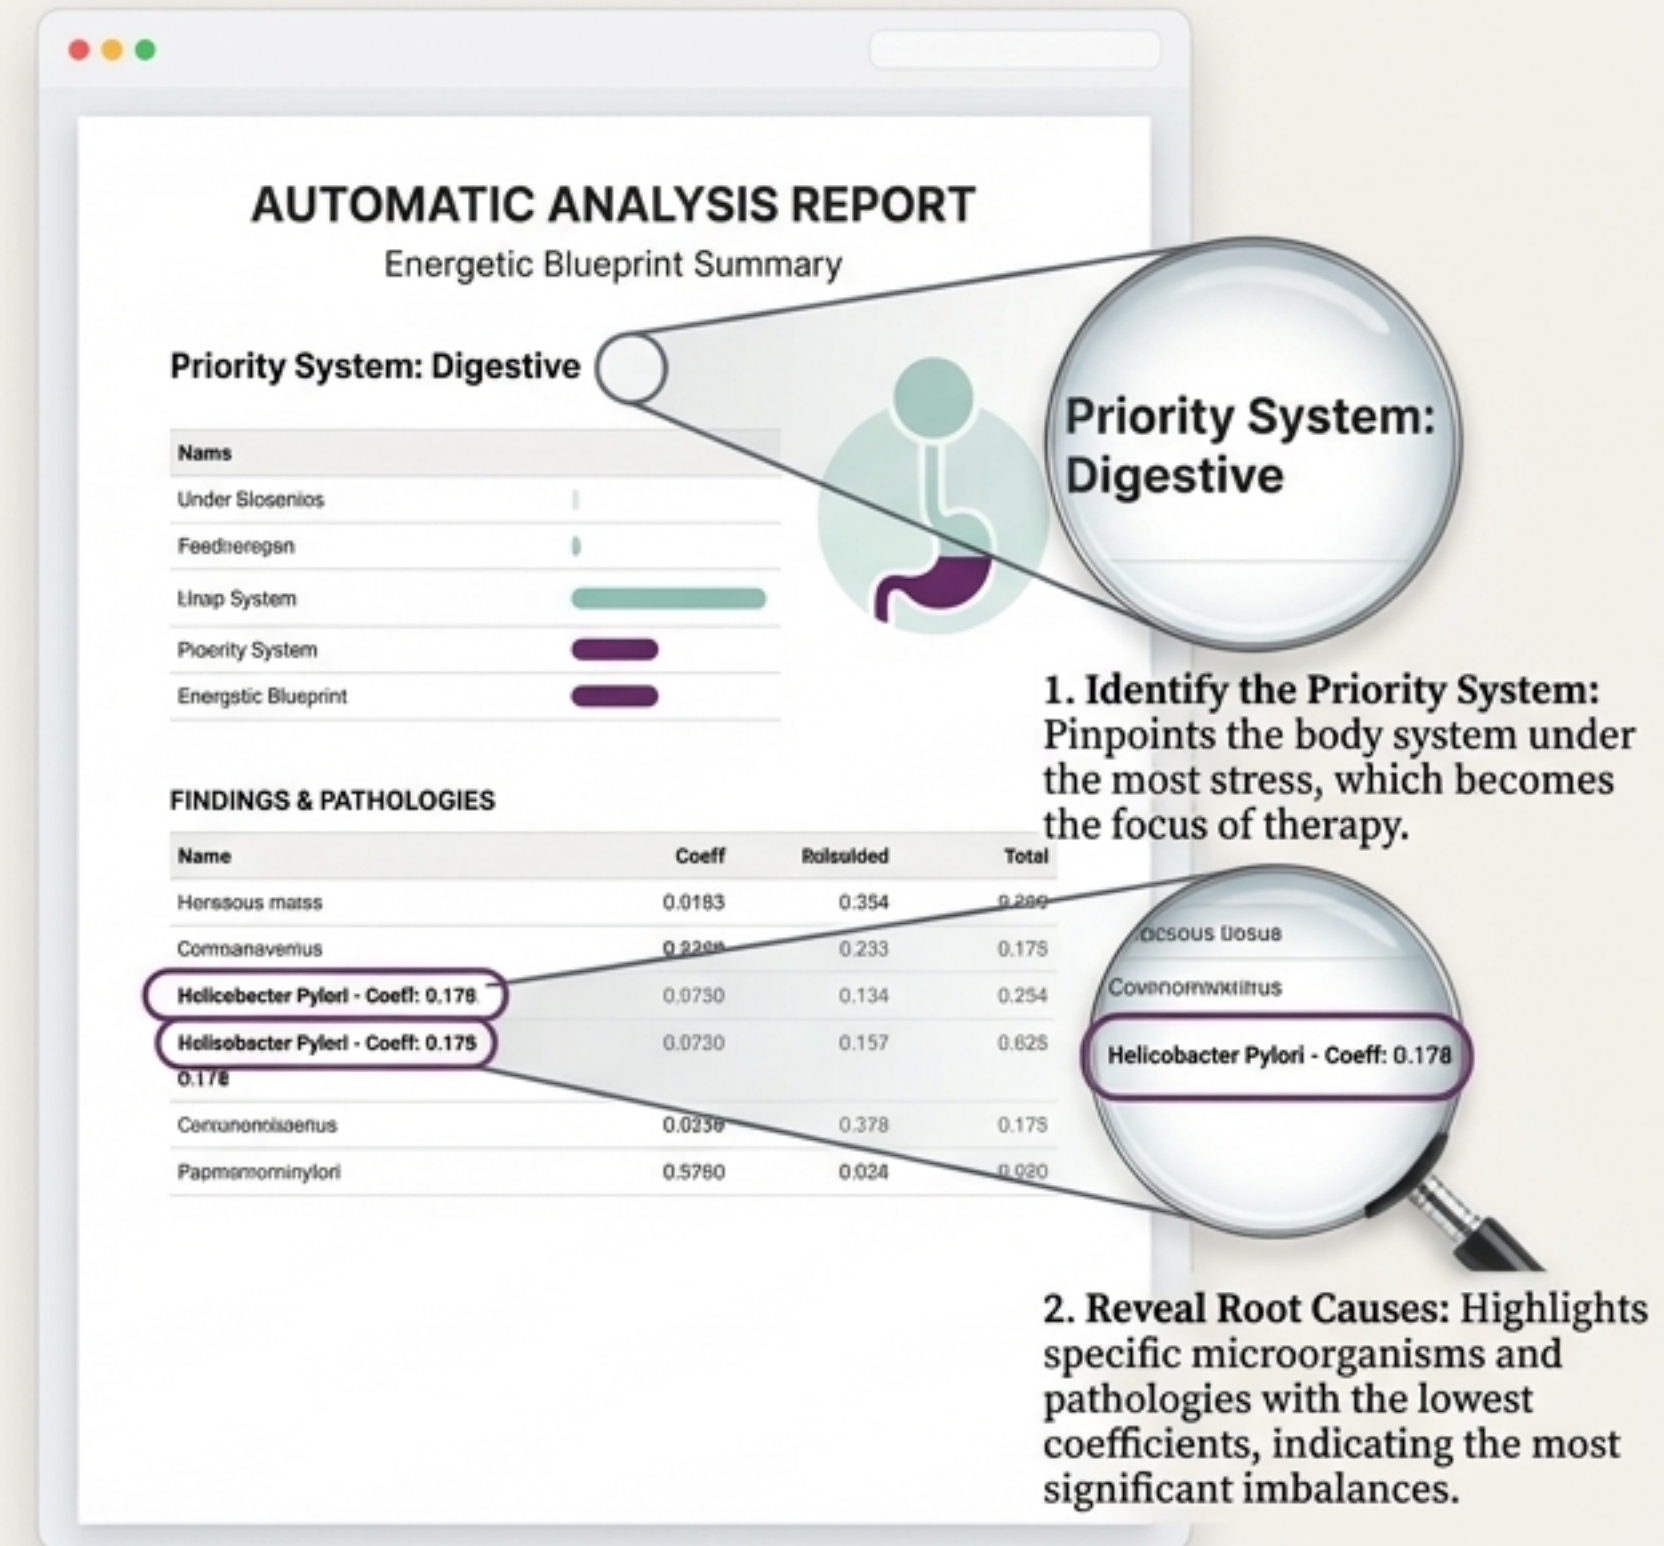

Step 2: ANALYZE – Uncovering Insights from the Report

How it Works:

The software automatically analyzes scan data from all organs to:

1. **Identify the Priority System:** Pinpoints the body system under the most stress, which becomes the focus of therapy.
2. **Reveal Root Causes:** Highlights specific microorganisms and pathologies with the lowest coefficients, indicating the most significant imbalances.

Key Principle: The system with the largest list of found problems is the priority for treatment.

Step 3: HARMONIZE – The Two Pillars of Therapy

Protective Meta-Therapy

Target: Organs and Systems.

Goal: Restore harmony and function to the body's own structures.

Protocol: For system therapies, administer 5 therapies (1x5) to each organ in the priority system.

Destructive Therapy

Target: Microorganisms (parasites, bacteria, viruses).

Goal: Neutralize and destroy pathogens using Dr. Rife frequencies.

Protocol: Administer 1x5 therapies for microorganisms, no more than 3 times per week to avoid detox reactions.

Tracking Progress on the Journey to Balance

The Long View: True bioenergetic rebalancing is a process. Expect to see significant shifts over **4-6 weeks** of consistent therapy.

Key Indicators of Improvement:

- 1. OD Values Rise:** The OD values of treated organs consistently rise towards and above the **1.200** threshold.
- 2. Coefficients Increase:** The coefficients of found microorganisms and pathologies get higher, indicating they are being neutralized and are no longer a priority issue.

Targeted Relief: Addressing Acute Symptoms

For specific, symptomatic challenges like pain, skin problems, or mental health issues, a more intense therapy protocol can provide relief.

The “Blast” Therapy Protocol

① Isolate

Use the search box on the RESEARCH page to find all items related to the symptom (e.g., search “joint” for joint pain, “brain” for mental health).

② Scan

Select and scan all relevant items.

③ Harmonize

Administer an intense “Blast” therapy of up to **5x5 therapies** (running the cycle of 5 therapies on each item 5 times) for powerful, targeted relief.

Deeper Analysis: Advanced Tools for Complex Cases

Manual Analysis

For granular, hands-on investigation of individual organs beyond the automatic report.

Source Serif Pro

Vegeto-Test

A scan used to confirm (weakening reaction) or deny (strengthening reaction) the presence of a specific item from the etalon database.

Source Serif Pro

Entropy & NLS Analysis

Assesses the severity of pathologies (Entropy) and the balance of biochemicals like hormones and vitamins (NLS).

Source Serif Pro

Cancer Screening Protocol

Utilizes manual analysis and Vegeto-testing on specific pathology etalons to screen for frequency imbalances related to cancer.
